

Visualize data with QuickSight

anglinpgj@gmail.com

Introducing Today's Project!

In this project, I will demonstrate how to store data in Amazon QuickSight. Creating an amazing dashboard and other visuals for data from QuickSight.

Tools and concepts

Services I used were AWS and QuickSite Key concepts I learnt include how to build and filter Data Visualizations for presentations.

Project reflection

This project took me approximately 90 minutes. The most challenging part was ensuring that my Filters were set properly. It was most rewarding to see the finished product.

After this project, I plan to work on Creating more AWS Projects.

Upload project files into S3

S3 is used in this project to store two files, which are manifest.json and netflix_titles.csv .

I edited the manifest.json file by updating it with the s3url for my netflix_titles.csv
It's important to edit this file to ensure that it's pulling the information from the correct place.

Create QuickSight account

Creating a QuickSight account cost is free as long as you pay attention you can get a free trial for up to 30 days.

Creating an account took me less than 3 minutes.

Download the Dataset

I connected the S3 bucket to QuickSight by visiting DataSets and setting up a new Dataset. I had to ensure that I had linked my S3 dataset to quicksight to get the information to QuickSight.

The manifest.json file was important in this step because that is the file that we used to pull the information from our netflix_titles.csv file. Without this file there would be no way to reference our information as the file is too large on its own.

Finish dataset creation

Table:

kaggle-netflix-data

Estimated table size:

6.5MB

SPICE

Data source:

kaggle-netflix-data

Import to SPICE

Augment with SageMaker

Visualize

My first visualization

To create visualizations on QuickSight, I went and chose my dataset and then Go to Analysis and clicked Add select chart type and drag fields to axes apply filters/aggregations and customized and saved an published.

The chart/graph shown here is a breakdown of them. I chose to have the records of the release year for my Donut graph and for my Bar graph I selected year of release and then type of show/movie.

I created this graph by simply clicking on "release_year" data label and changing the auto generated information and then adding the type to make the bar graph look better.

Using filters

Filters are useful for narrowing down the results of large data sets to work to draw new inferences from the information that you have gathered.

This visualization is a breakdown of all netflix shows/movies and the release dates of them.

Setting up a dashboard

As a finishing touch, I went in and added titles to all of my graphs.

Did you know you could export your dashboard as PDFs too? I did this by publishing my dashboard and then by selecting export and selecting as a pdf after the file was finished.
